

Don't you think all Townsville children deserve the **best chance in life?**

There are 58 major studies confirming

**FLUORIDE IS
NEUROTOXIC**

So why does
fluoridation
continue?

FLUORIDE AND PREGNANCY DON'T MIX!

- There is absolutely no need to expose a baby's developing brain to a neurotoxin;
- Applying the precautionary principle would ensure the fetus is never exposed to fluoride;
- A bottle-fed baby consuming formula with fluoridated water receives up to 250 times more fluoride than a breast-fed baby;
- Pregnant mothers are warned about other neurotoxins such as alcohol, cigarettes, lead and mercury. It's time they were warned about neurotoxic fluoride;
- Many studies also show that fluoride can damage the brain, kidneys, bones, thyroid gland, pineal gland and even the teeth;
- Fluoridation chemicals are a highly-toxic and contaminated waste by-product from the processing of phosphate fertilizer;
- There is no discernible difference in tooth decay rates between fluoridated and non-fluoridated countries, cities, regions.

"It's actually very similar to the effect size that's seen with childhood exposure to lead"

David Bellinger, PhD, MSc, Professor of Neurology, Harvard Medical School.
